

# Demographic Characteristics of residents

## **Chapter I**

# **Demographic characteristics of residents**

Given the absence of comprehensive population surveys, and with the last census held in 1932, sample studies provide the only option for estimating the number of residents in Lebanon, as well as to identify their demographic, educational, professional, health and other characteristics. The National Survey of Household Living Conditions 2004-2005 (The Multipurpose Survey) is considered the most recent in this domain, and it reveals numerous characteristics related to households and individuals residing in Lebanon.

### **1.**

#### **Number of residents and their geographic distribution**

The population of Lebanon was estimated in 2004, according to the National Survey of Household Living Conditions (The Multipurpose Survey), at 3,755,034 (with the exception of those residing in the Palestinian camps). The Lebanese represent 93.4% of the population, with 6.6% being non-Lebanese.

Beirut and its suburbs, in addition to the coastline of Lebanon, make up the basic concentration areas of population allocation. The survey's data reveal that Lebanon's middle regions, consisting of the governorates of Beirut and Mount Lebanon, comprise 50.4% of Lebanon's residents, with the rest of the population distributed among the remaining four governorates accordingly: 20.5% in North Lebanon, 12.5% in the Bekaa, 10.7% in South Lebanon and 5.9% in Nabatieh.

The overall average household size in Lebanon has declined from 5.4 individuals per household in 1970, and 4.8 individuals in 1997, to 4.3 individuals in 2004. The

minimum discrepancy is 3.8 individuals in Beirut, and the maximum discrepancy is 4.7 individuals in the North Lebanon governorate. The average percentage of households per governorate differs from the average percentage of individuals per governorate due to the difference in the size of the households.

Moreover, the survey results demonstrate that the population density per governorates varies between a maximum of 21,938 persons per square km in Beirut, and a minimum of 110 individuals per square km in the Bekaa. This disparity in population distribution and population density demonstrates a clear need to reevaluate the provision of educational, health and leisure services within the various regions of Lebanon, in addition to the necessity of increasing job opportunities to limit internal migration. See table (1-1)

**Table (1-1)**
**Distribution of households and individuals, average household size and average population density, by governorate**

Governorate	Number of individuals	Percentage of individuals	Number of households	Percentage of households	Average household size
Beirut	390,503	10.4	101,695	11.6	3.84
Mount Lebanon	1,501,570	40.0	371,289	42.2	4.04

Lebanon	3,755,034	100.0	879,855	100.0	4.27

A comparison of the distribution of population in 2004 with that of 1970<sup>1</sup> and 1997<sup>2</sup> per governorate shows that approximately 50% of the population was based in the governorates of Beirut and Mount Lebanon between 1997 and 2004, versus 60% in 1970. Additionally, there is a slight increase in the percentage of current residents in Mount Lebanon, the result of internal migration from the governorates of South Lebanon, Nabatieh and the Bekaa. See table (1-2)

**2.****Family structure and residential density within the dwelling**

The family structure in Lebanon is mostly a nuclear one, consisting of the head of household, spouse (husband/wife) and children. Table (1-3) below shows that for every 1,000 heads of households there are 795 spouses and 2,259 children and less than 100 others relatives. The type of family structure is relatively similar within the periphery governorates, but differs in Beirut and Mount Lebanon, in particular in terms of the number of children for every 1,000 household heads. Additionally, 85.8% of households have a male head of household, and 14.2% of households are headed by women.

**Table (1-3)**

**Distribution of household residents (by governorates) based on their relationship with head of household, per 1,000 household heads**

The results of the National Survey of Household Living Conditions (The Multipurpose Survey) reveal that most households are made up of four residents (19.7%) or five (18.5%). The percentage of households made up of seven or more residents is 12.6%, and the percentage of households made up of one person is 7.3%. See table (1-4). Most of the latter are made up of elderly people, (41.9% of single-person households are the elderly, aged 65 years and above), and most of these elderly are women. See table (1-5).

Most households, (48.1%), have an average density of residents, with the average number of individuals per room ranging between one and two. The percentage of households living in unacceptable conditions, (with an average of more than two individuals per room), is 16.7%. The distribution of households according to their residential density differs among governorates. See table (1-7) Discrepancies in household density between the governorates are relatively rare, with the exception of Beirut.

## 3.

**Age pyramid and its characteristics**

Lebanon is witnessing numerous demographic changes in the average age at marriage, and in the patterns of births, deaths and external immigration, which is reflected in the demographic structure. The age pyramid for Lebanon portrays these changes clearly, marking significant demographic traits including the population distribution according to age groups, the male-to-female ratio among age groups, and the average age of household breadwinners. Table (1-9) shows the distribution of individuals in Lebanon according to age groups and the relevant age pyramid, and discloses the following basic demographic traits:

- A decline within the age groups (0-4) and (5-9) is related to the later categories (10-14), (15-19) and (20-24), as a result of a reduction in fertility during the past ten years.
- A great difference exists between percentage of males in the (20-24) age group, and those in the (25-29) age group and above, which may be due to the immigration abroad of the latter age groups.
- A decline in male-to-female ratio within age groups 25 to 64 is the result of various reasons, one of which may be the external immigration of males.

Male-to-female ratio = (number of males ÷ number of females) × 100

**Table (1-9)**

**Percentage distribution of population according to age, sex, male-to-female ratio and age groups**

Decline in male-to-female ratio

\* The male-to-female ratio varies usually at birth between 103% and 107% in a census. The reason behind the 113.7% figure within the age group (0-4) is the margin of error resulting from sampling, taking into consideration the size of the basic sample on the one hand, and the relatively small sample size regarding this age group, on the other.

The age dependency rate is 53.3% in Lebanon, and varies among the governorates within a minimum of 43.5% in Beirut and a maximum of 66.3% in Nabatieh. See table (1-10)

Age dependency rate = [(number of individuals of age group (under 15 years) + number of individuals of age group (64 years and above)) ÷ (number of individuals of age group (15-64 years))] × 100

#### **4.** **Celibacy averages**

One of the main demographic trends in Lebanon is the late marriage age for both males and females, started a few years ago and is currently still evident. A comparison of the years 1970, 1997 and 2004, for the whole of Lebanon, reveals that the female unmarried percentage has risen to around double its original size for many of the age categories when 1970 is compared with 1997 and 2004. The unmarried male percentage remained constant between 1997 and 2004, but rose between 150-200% between 1970, and 1997 and 2004.

By comparing governorates, a significant discrepancy appears in celibacy among both males and females, especially within the age groups of 25 years and above for males, and 20 years and above for females. The unmarried percentage for age group (25-29) for males, for instance, varies between a minimum of 59.5% in North Lebanon and a maximum of 78.7% in Beirut. The unmarried percentage for age group (25-29) for females varies between a minimum of 30.6% in Nabatieh and a maximum of 62.9% in Beirut. See tables (1-11) and (1-12)

Celibacy average = (number of celibates within an age group ÷ total number of individuals within this age group) × 100

### **Population distribution according to place of registration when compared with place of residence**

The available data within the National Survey of Household Living Conditions (The Multipurpose Survey) demonstrate the presence of a significant percentage of the population who do not reside in their place of registration. Table (1-13) below shows the distribution of Lebanese according to place of registration and place of residence per governorate. This table also reveals that significant percentages of the registered population in the periphery governorates (especially the Bekaa, South Lebanon and Nabatieh) reside in Beirut and Mount Lebanon, as only 60.9% of Beirut's residents are registered in Beirut and 39.1% are registered elsewhere, mostly in Mount Lebanon (14.6%) and Nabatieh (10.5%). Moreover, less than half of the residents of Mount Lebanon are registered in Mount Lebanon itself, and 51.6% of them are registered in other governorates, mainly Nabatieh (15.6%), the Bekaa (14.4%) and Beirut (9%).
